GALGOTIAS UNIVERSITY

SCHOOL OF COMPUTING SCIENCE & ENGINEERING

PROJECT APPROVAL FORM AND ABSTRACT

Odd 2025-2026

B. Tech Project Details

Project ID: BT0062

Title	**Prism: A Multi-Model AI Meta-Search Engine**		
Project Type	☐ Community based design problem (Interdisciplinary) ☐ App Development / Utility ☐ IOT/Hardware based ☑ AI/ML/Data Science ☐ Healthcare Projects	**Project Outcome**	☑ Project and Research Paper ☐ Project and Patent ☐ Project and Book Chapter
		SDG Goal Number	
Publication Target	☐ SCOPUS Journal ☑ SCOPUS Conference ☐ SCOPUS Book Chapter ☐ SCI Journal	**Guide Name: Ms. Anjali Patel**	

Student Details:

S. No	Name	Enrollment Number	Admission Number	Program / Branch	Sem
1	Ayush Sharma	22131180078	22SCSE1180075	CSE (AI&MI)	7th
2	Divyanshu Rai	22131180014	22SCSE1180002	CSE (AI&MI)	7th

Sustainable Development Goals (SDG Goals), Targets and Indicators

Goal 1: End poverty in all its forms everywhere
Goal 2: End hunger, achieve food security and improved nutrition and promote sustainable agriculture
Goal 3: Ensure healthy lives and promote well-being for all at all agessaf
Goal 4: Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
Goal 5: Achieve gender equality and empower all women and girls
Goal 6: Ensure availability and sustainable management of water and sanitation for all
Goal 7: Ensure access to affordable, reliable, sustainable and modern energy for all
Goal 8: Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all
Goal 9: Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation
Goal 10: Reduce inequality within and among countries
Goal 11: Make cities and human settlements inclusive, safe, resilient and sustainable
Goal 12: Ensure sustainable consumption and production patterns
Goal 13: Take urgent action to combat climate change and its impacts
Goal 14: Conserve and sustainably use the oceans, seas and marine resources for sustainable development
Goal 15: Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss
Goal 16: Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels
Goal 17: Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

Prism: A Multi-Model AI Meta-Search Engine

Area/Domain of Project: Artificial Intelligence and Machine Learning

ABSTRACT:

Large Language Models (LLMs) like GPT and Gemini have transformed information retrieval and question answering. However, users struggle with bias, incomplete, or contradictory response issues when using a single model, leading to a lack of confidence in the information provided by AI. We present here Prism, an anticipated multi-model AI meta-search engine which aims to aggregate together and synthesize answers from multiple LLMs it queries. In this design, a user's query is simultaneously sent to multiple models, and the output from all queried models is then aggregated and processed by a synthesis module. A synthesis module has the capacity to guide and combine the multiple responses into one coherent answer, following the meta-prompting and ranking mechanisms. By combining strengths of multiple models together this design hopes to reduce some of the weaknesses including bias and incompleteness. The system will be evaluated against a variety of queries and compared to the results of single model queries based on factuality, completeness, and conciseness metrics. We expect this meta-search strategy will yield more reliable and helpful answers for users. This abstract presents the idea and intended outcomes of Prism, and will provide further understanding once our project develops and tests it.

Problem Statement:

- **Inconsistency and Contradiction :** Different LLMs, trained on different datasets and with different architectures, often provide contradictory answers to the same question. For example, asking "What is the best framework for web development?" might yield Python/Django from one model and JavaScript/React from another. This leaves the user confused about which source to trust.
- **Incompleteness and "Model Blindspots" :** No single AI model is omniscient. One model might provide a great explanation of a scientific concept but miss its historical context, while another model might excel at the historical context but oversimplify the science. A user relying on only one of these models receives an incomplete picture. This is like asking a single expert for their opinion when a panel of experts would provide a more well-rounded view.
- **Implicit Bias :** Every LLM has inherent biases learned from its training data. Relying on a single model exposes the user to a single, concentrated source of bias. By querying multiple models, it becomes possible to identify, compare, and potentially mitigate these biases in a synthesized result.
